

Never before has the awareness of water conservation and its critical role in our lives been so apparent. To help us all rise to this challenge, we will begin offering a proprietary blend of soil moisture technology designed to reduce overall watering while eliminating or minimizing plant wilt cycles and drought stress.

Without Moisture Manager™

With Moisture Manager™

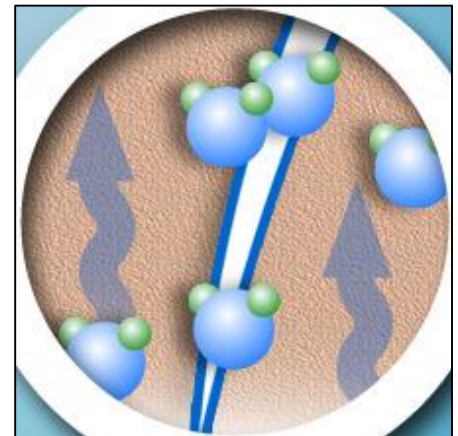

One of our owners did a test in the spring. On Thursday, identical New Guinea hanging baskets were watered the same. Moisture Manager™ was then applied. No additional water was added. Here are the results on Monday.

Benefits for turf & annuals...

- ✓ Reduce watering up to 50%
- ✓ Control or eliminate dry spots
 - ✓ Minimize hand watering
 - ✓ Improve seed germination
 - ✓ Drought protection

Our certified applicators will begin this new water conservation technology in June. Applications can be effective for up to three months.

Irrigation is recommended immediately however within 3-5 days is acceptable. Moisture Manager is not a plant food. It is biodegradable and contains no phosphates or ground water run off contamination.

Moisture Manager™ forms a subsurface film which attracts and stores moisture as microscopic droplets on plant roots and soil particle surfaces. These droplets are drawn into plant roots while the Moisture Manager™ remains in place extracting additional moisture from humidity with the soil.
